

What is the purpose of CREAD?

If you care for a loved one and you have noticed that they are getting forgetful or confused, it can be a worrying time.

You may have spoken to healthcare professionals about this and discussed the possibility that the person you care for has memory or thought processing problems that may be the early symptoms of Alzheimer's or mild Alzheimer's disease.

The CREAD clinical research study is designed to see if an investigational study medication can slow the progression of prodromal (early) to mild Alzheimer's disease.

Approximately 750 people around the world will take part, each with a Study Partner who cares for them – someone like you.
